2023 Cybersecurity New Year's Resolutions

(1) **Embrace a threat first mindset:** For most it won't be a zero day but something unexpected like Met Opera DDOS attack. The best threat data is your own. Look at events & incidents last year, then previous 5 years. Use threat analysis information from industry cybersecurity reports. Look at similar industries, similar size, similar region, there are a variety of ways to slice the data.

* Be critical of data source reports with validated data!

(2) **Expand your threat metrics:** Cybersecurity is the most likely business impact event for business in 2023. Broaden your data for better intelligence. Look at HR incidents, fraud incidents, physical security incidents.

(3) Aim for risk analysis instead of risk assessments: Implementing risk analysis doesn't require perfect or volumes of data. Initiate by thinking accuracy instead of precision with continuous improvement.

(4) Identity is the only perimeter: People, devices, applications, & services, concentrate on accelerating maturity (there will be more Okta & LastPass type attacks).

(5) Prioritize Third Party threat model process: (4th, 5th, 6th etc party. Even if there is a program in place, it's probably not where it should be.

A few of the breaches in the last month due to a third party: Teqtivity (Uber breach) CloudSEK (Atlassian) & Centers for Medicare & Medicaid Services (Healthcare Management Solutions).
